

# Comprehensive Waste Management Project

~ By Shaurya (230961)

## Objective:

Detailed waste management plan for the **phosphoric acid production process (wet process)**, integrating process optimization, material and energy balances, life cycle assessment (LCA), product carbon footprint (PCF) assessment, and cost-benefit analysis.

## 1. Industry & Process:

Chemical manufacturing Industry : Phosphoric Acid production through wet process

## 2. Process Flow and Material/Energy Balances:

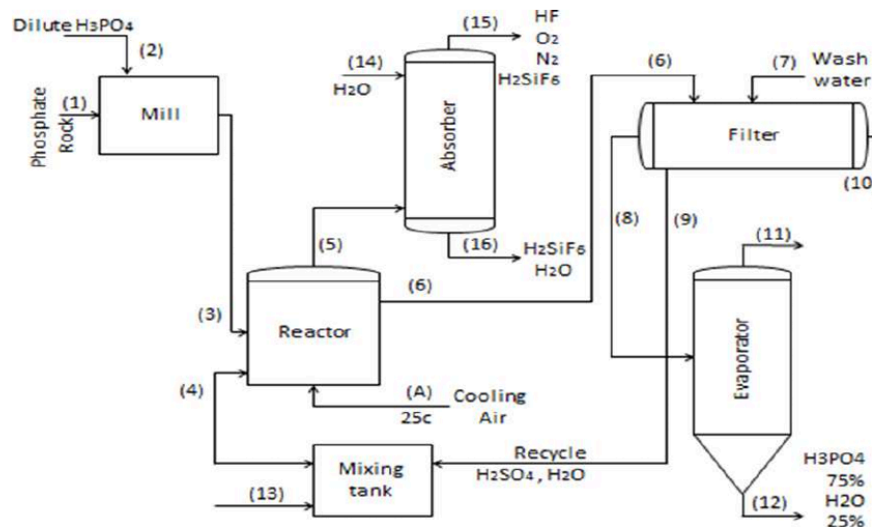

- Process Flow Diagram (PFD) :

### Reactions:

#### i. Main Reaction

#### ii. Side Reaction

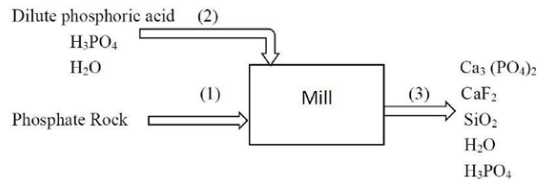

- Material Balance :

### Assumptions

~ H<sub>3</sub>PO<sub>4</sub> Production = 1000 ton/day = 10<sup>6</sup> kg/day = 42000 kg/hr = 429 kmol/hr

Yield = 95%, Conc of  $\text{H}_2\text{SO}_4$  = 94%,  $\text{H}_2\text{SO}_4$  Excess = 15%  
 ~ Product stream =  $42000/0.75 = 56000 \text{ kg/hr}$   
 ~  $\text{H}_2\text{O}$  Stream =  $0.25 \times 56000 = 14000 \text{ kg/hr}$   
 ~ From Reaction (1) :  $\text{Ca}_3(\text{PO}_4)_2 = 0.5 \times 429 \text{ kmol/hr} = 214.5 \text{ kmol/hr} = 66.5 \text{ kg/hr}$   
 ~ Since Yield = 95%, Feed  $\text{Ca}_3(\text{PO}_4)_2 = 429/0.95 = 451.5 \text{ kmol/hr} = 140000 \text{ kg/hr}$

a) Around Mill:

Stream - 1 : Phosphate Rock Composition [ $\text{Ca}_3(\text{PO}_4)_2$  (75%),  $\text{CaF}_2$  (20%) ,  $\text{SiO}_2$  (5%)]

$\text{Ca}_3(\text{PO}_4)_2 = 140000 \text{ kg/hr}$ ;  $\text{CaF}_2 = 0.2 \times 187000 = 37400 \text{ kg/hr}$

$\text{SiO}_2 = 0.05 \times 187000 = 9350 \text{ kg/hr}$

Stream - 2 : Dilute Phosphoric Acid [ $\text{H}_2\text{O}$  (85%),  $\text{H}_3\text{PO}_4$  (15%)] =  $0.5 \times 187000 = 93500 \text{ kg/hr}$  ( Considering dil  $\text{H}_3\text{PO}_4$  : Phosphate Rock = 1:2 )

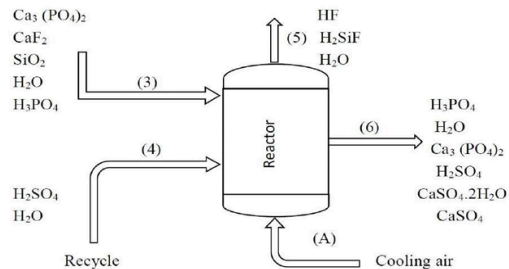

$\text{H}_2\text{O} = 93500 \times 0.85 = 79500 \text{ kg/hr}$ ;  $\text{H}_3\text{PO}_4 = 93500 \times 0.15 = 14000 \text{ kg/hr}$

| Composition                  | Stream-1 | Stream-2 | Stream-3 |
|------------------------------|----------|----------|----------|
| $\text{Ca}_3(\text{PO}_4)_2$ | 140000   |          | 140000   |
| $\text{CaF}_2$               | 37400    |          | 37400    |
| $\text{SiO}_2$               | 9350     |          | 9350     |
| $\text{H}_2\text{O}$         |          | 79500    | 79500    |
| $\text{H}_3\text{PO}_4$      |          | 14000    | 14000    |

**Mass In** :  $140000 + 37400 + 9350 + 79500 + 14000 = 280250$

**Mass out** :  $140000 + 37400 + 9350 + 79500 + 14000 = 280250$

b) Around Reactor:

H<sub>3</sub>PO<sub>4</sub> production = 429 kmol/hr

Reaction 1:

Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub> reacted = 429/2 = 214.5 kmol/hr

Unreacted Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub> = 452-214.5 = 237.5 kmol/hr

H<sub>2</sub>SO<sub>4</sub> reacted = 3/2 \* 429 = 643.5 kmol/hr

H<sub>2</sub>O reacted = 6/2 \* 429 = 1287 kmol/hr

CaSO<sub>4</sub>.2H<sub>2</sub>O produced = 3/2 \* 429 = 643.5 kmol/hr

Reaction 2:

In CaF<sub>2</sub> = reacted CaF<sub>2</sub> = 480 kmol/hr Reacted

H<sub>2</sub>SO<sub>4</sub> = 480 kmol/hr

Produced HF = 2 \* 480 = 960 kmol/hr

Produced CaSO<sub>4</sub> = 480 kmol/hr

Reaction 3:

In SiO<sub>2</sub> = reacted SiO<sub>2</sub> = 156 kmol/hr

Reacted HF = 6 \* 156 = 936 kmol/hr

Produced H<sub>2</sub>SiF<sub>6</sub> = 156 kmol/hr

Produced H<sub>2</sub>O = 2 \* 156 = 312 kmol/hr

Stream 4:

Total H<sub>2</sub>SO<sub>4</sub> reacted = 643.5 + 480 = 1123.5 kmol/hr = 110000 kg/hr

Excess H<sub>2</sub>SO<sub>4</sub> = 15% → 0.15 = (in-reacted)/in = 0.15 = (in-110000)/110000

In = 126630 kg/hr

Non reacted H<sub>2</sub>SO<sub>4</sub> = 126630 - 110000 = 16530 kg/hr

H<sub>2</sub>SO<sub>4</sub> concentration 94%: 126630/0.94 = 134700 kg/hr

H<sub>2</sub>SO<sub>4</sub> = 126630 kg/hr

H<sub>2</sub>O = 134700 - 126600 = 8100 kg/hr

Stream 6:

H<sub>3</sub>PO<sub>4</sub> = 42000 + 14000 = 56000 kg/hr

H<sub>2</sub>O = 79500 + 8100 + 5600 - 23130 = 70000 kg/hr

Ca<sub>3</sub>(PO<sub>4</sub>)<sub>2</sub> = 73600 kg/hr

CaSO<sub>4</sub>.2H<sub>2</sub>O = 110700 kg/hr

H<sub>2</sub>SO<sub>4</sub> = 16500 kg/hr

CaSO<sub>4</sub> = 65250 kg/hr

Stream 5:

H<sub>2</sub>SiF<sub>6</sub> = 22450 kg/hr

H<sub>2</sub>O = assume 50% of H<sub>2</sub>O from stream 6 is vaporized: 0.5 \* 70000 = 35000 kg/hr

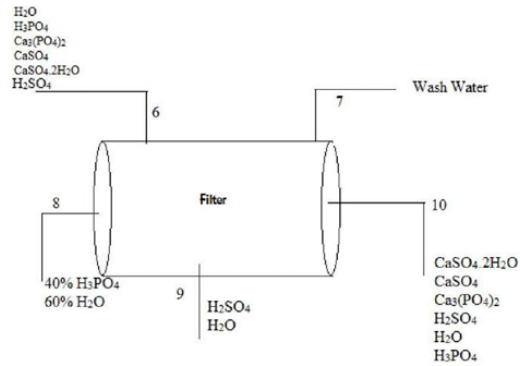

HF = produced - reacted = 960 - 936 = 24 kmol/hr = 480 kg/hr

Cooling air stream: 79% Nitrogen, 21% Oxygen

**Mass In :** Stream 3 + Stream 4 = 140000 + 37400 + 9350 + 79500 + 14000 + 8100 + 126630 = 414980 kg/hr

**Mass Out :** Stream 5 + Stream 6 = 35000 + 22450 + 73600 + 35000 + 56000 + 16500 + 110700 + 65250 + 480 = 414980 kg/hr

c) Around Filter:

**Stream 10:**  $\text{H}_3\text{PO}_4 = 14000 \text{ kg/hr}$

**Stream 8:**  $\text{H}_3\text{PO}_4 = 56000 - 14000 = 42000 \text{ kg/hr}$

Total stream 8 =  $42000/0.4 = 105000 \text{ kg/hr}$

$\text{H}_2\text{O}$  in stream 8 =  $0.6 * 105000 = 63000 \text{ kg/hr}$

(Assuming 1.5% of  $\text{H}_2\text{SO}_4$  &  $\text{H}_2\text{O}$  goes with gypsum for easy filtration)

$\text{H}_2\text{SO}_4$  in stream 10 =  $16500 * 0.015 = 247.5 \text{ kg/hr}$

$\text{H}_2\text{SO}_4$  in stream 9 =  $16500 - 247.5 = 16252.5 \text{ kg/hr}$

$\text{H}_2\text{O}$  in stream 10 =  $35000 * 0.015 = 525 \text{ kg/hr}$

(Since Stream 9 recycles back to the reactor and the acid conc needs to be at 94%)

Total stream 9 =  $\text{H}_2\text{SO}_4 / 0.94 = 16252.5/0.94 = 17290 \text{ kg/hr}$

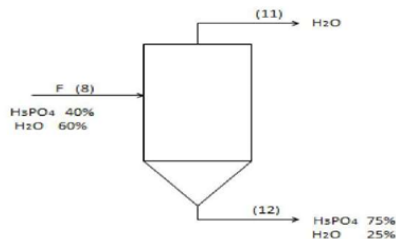

$\text{H}_2\text{O}$  in stream 9 =  $17290 * 0.06 = 1037.5 \text{ kg/hr}$

$\text{H}_2\text{O}$  in stream 7 =  $-35000 + 63000 + 525 + 1037.5 = 29562.5 \text{ kg/hr}$

**Mass In :** Stream (6+7) =  $73600 + 35000 + 16500 + 56000 + 110700 + 65250 + 29562.5 = 386612.5 \text{ kg/hr}$

**Mass Out :** Stream (8+9+10) =  $63000 + 42000 + 1037.5 + 16252.5 + 73600 + 525 + 247.5 + 14000 + 110700 + 65250 = 386612.5 \text{ kg/hr}$

d) Around Evaporator:

Stream 8(F) composition:  $\text{H}_3\text{PO}_4 = 42000 \text{ kg/hr}$ ,  $\text{H}_2\text{O} = 63000 \text{ kg/hr}$

Material balance on  $\text{H}_3\text{PO}_4$ :

$0.4 * F = 0.75 * \text{Stream 12}$

$0.4 * 105000 = 0.75 * \text{Stream 12}$

Stream 12 =  $56000 \text{ kg/hr}$

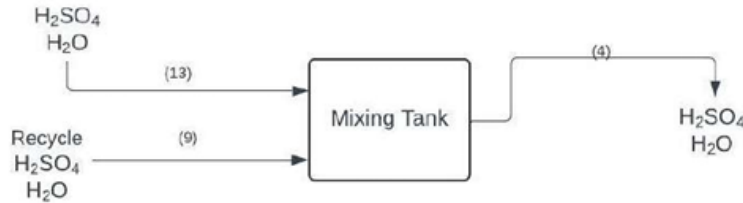

$\text{H}_2\text{O}$  in Stream 12 =  $0.25 * 56000 = 14000 \text{ kg/hr}$

$\text{H}_2\text{O}$  in Stream 11 =  $63000 - 14000 = 49000 \text{ kg/hr}$

**Mass In :** Stream 8 =  $42000 + 63000 = 105000 \text{ kg/hr}$

**Mass Out :** Stream (11+12) = 49000 + 14000 + 42000 = 105000 kg/hr

e) Around Mixing Tank:

Stream 4: H<sub>2</sub>SO<sub>4</sub> = 126630 kg/hr, H<sub>2</sub>O = 8100 kg/hr

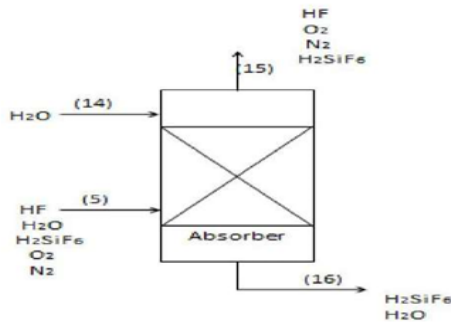

Stream 9: H<sub>2</sub>SO<sub>4</sub> = 16252.5 kg/hr, H<sub>2</sub>O = 1037.5 kg/hr

Stream 13: H<sub>2</sub>SO<sub>4</sub> = 126630 – 16252.5 = 110377.5 kg/hr , H<sub>2</sub>O = 8100 – 1037.5 = 7062.5 kg/hr

**Mass In :** 16252.5 + 1037.5 + 110377.5 + 7062.5 = 134730 kg/hr

**Mass Out :** 126630 + 8100 = 134730 kg/hr

f) Around Absorber:

Assume 99% recovery: H<sub>2</sub>SiF<sub>6</sub> in stream 16 = 0.99 \* 22450 = 22225.5 kg/hr

H<sub>2</sub>SiF<sub>6</sub> in stream 15 = 22450 – 22225.5 = 224.5 kg/hr

(Assuming the amount of water in stream 16 made H<sub>2</sub>SiF<sub>6</sub> into 15%)

Total stream 16 = 22225.5 0.15 = 148170 kg/hr

H<sub>2</sub>O in stream 16 = 0.85 \* 148170 = 125944.5 kg/hr

H<sub>2</sub>O in stream 14 = 125944.5 – 35000 = 90944.5 kg/hr

**Mass In :** 22450 + 35000 + 480 + 90944.5 = 148874.5

**Mass Out :** 224.5 + 480 + 22225.5 + 125944.5 = 148874.5 kg/hr

- **Energy Balance :**

a) **Around Reactor :**

Operating Conditions : T = 75-80°C, P = 1 atm, T<sub>ref</sub> = 25°C

Heat In = Heat Out

$\sum mC_p \Delta T + \sum n\Delta H_{\text{reaction}} = Q + \text{Latent Heat ; where}$

$\Delta H_{\text{reaction}} = \sum \Delta H_{\text{products}}^f - \sum \Delta H_{\text{reactants}}^f$

b) **Around Evaporator :**

Heat In = Heat Out,  $T_{ref} = 72^{\circ}\text{C}$

$$m \text{ CpH}_3\text{PO}_4 \text{ dT} + m \text{ CpH}_2\text{O} \text{ dT} + Q = m \text{ CpH}_2\text{O} \text{ dT} + m \Delta\text{H}_2\text{O} + m \text{ CpH}_3\text{PO}_4 \text{ dT} + m \text{ CpH}_2\text{O} \text{ dT}$$

### 3. Identify Waste Streams:

- Waste Streams ( liquid, solid & gases ) :

| Stream      | Physical State | Component  |
|-------------|----------------|--|
| Stream (10) | Solid (S)      | Gypsum ( $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ ) |
|             | Liquid (L)     | $\text{H}_2\text{SO}_4$                              |
| Stream (15) | Gas (G)        | HF   |
| Stream (16) | Liquid (L)     | $\text{H}_2\text{SiF}_6$                             |

- Current Handling/Disposal Methods :

- Gypsum Disposal - Disposed in Land / Sea
- $\text{H}_2\text{SO}_4$  - Neutralized before disposal
- HF - Wet Scrubbing
- $\text{H}_2\text{SiF}_6$  - Used in Water Fluoridation

### 4. Propose Optimization Strategies:

- Process improvements to reduce waste generation / increase resource efficiency :

- Absorber Gas Recovery Enhancement:

- Upgrade absorber design with multi-stage scrubbing and pH-controlled water/alkali solution.
- Improve packing material and residence time for better absorption efficiency.

| Metrics  | Before   | After |
|--|----------|-------|
| HF loss in gas (kg/hr)                           | ~ 480    | < 480 |
| $\text{H}_2\text{SiF}_6$ recovery efficiency (%) | ~ 70-75% | >95%  |
| Revenue from $\text{H}_2\text{SiF}_6$            | Medium   | High  |

- Reactor Cooling Optimization:

- Use **heat exchangers** to recover thermal energy from reactor cooling air and preheat incoming feed (Stream 2 or 3).

| Parameter           | Before   | After       |
|---------------------|----------|-------------|
| Cooling Energy Loss | High     | Reduced     |
| Energy Recovery     | None     | Significant |
| Overall Efficiency  | Moderate | Improved    |

## 5. Conduct Life Cycle Assessment (LCA) and Product Carbon Footprint (PCF):

### Goal & Scope Definition:

- **Objective:** Calculate GWP (kg CO<sub>2</sub>-eq) and PCF (kg CO<sub>2</sub>-eq/kg H<sub>3</sub>PO<sub>4</sub>).
- **Functional Unit:** 1 ton (1000 kg) of phosphoric acid produced.
- **System Boundary:** Cradle-to-gate (raw material extraction to product output).

### Life Cycle Inventory (LCI)

| Inputs  | Stage                       | Outputs(Emissions/Products/Wastes)  |
|---|-----------------------------|---|
| - Phosphate rock (Ca <sub>3</sub> (PO <sub>4</sub> ) <sub>2</sub> , CaF <sub>2</sub> , SiO <sub>2</sub> )<br>- Sulfur (for H <sub>2</sub> SO <sub>4</sub> production) | Raw Material Extraction     | - CO <sub>2</sub> from mining equipment<br>- Particulate matter (dust)  |
| - Sulfur → H <sub>2</sub> SO <sub>4</sub> (via combustion + contact process)<br>- Water   | Material Processing         | - SO <sub>2</sub> , trace H <sub>2</sub> SO <sub>4</sub> vapors<br>- Heat and electricity use emissions                                     |
| - Phosphate rock<br>- H <sub>2</sub> SO <sub>4</sub><br>- Dil. H <sub>3</sub> PO <sub>4</sub><br>- H <sub>2</sub> O   | Reaction (Reactor)          | - H <sub>3</sub> PO <sub>4</sub> (product)<br>- Gypsum (solid)<br>- HF (gas)<br>- Heat loss   |
| - Air (cooling)<br>- Absorbent water  | Gas Absorption              | H <sub>2</sub> SiF <sub>6</sub> (captured)<br>- Uncaptured HF (fugitive)  |
| - Energy (filtration)   | Filtration                  | - Recovered H <sub>3</sub> PO <sub>4</sub><br>- Gypsum (CaSO <sub>4</sub> ·2H <sub>2</sub> O) with traces of H <sub>2</sub> SO <sub>4</sub> |
| - Steam (energy input)  | Evaporation / Concentration | - Concentrated H <sub>3</sub> PO <sub>4</sub> (75%)<br>- Water vapor (released or recycled)   |
| - Process water<br>- Recycled H <sub>2</sub> SO <sub>4</sub> stream   | Waste Handling / Recycling  | - Treated effluents<br>- Potential emissions (HF, H <sub>2</sub> SiF <sub>6</sub> ) if not fully captured                                   |
| - Electricity<br>- Cooling water  | Utilities & Energy          | - CO <sub>2</sub> from grid electricity<br>- Thermal losses   |

|                   |  |                           |
|-------------------|--|---------------------------|
| - Steam (boilers) |  | - Cooling water discharge |
|-------------------|--|---------------------------|

**Life Cycle Impact Assessment (LCIA) & Baseline & Optimized Scenario**

| Impact Category                               | Description  | Baseline Scenario   | Optimized Scenario                  | Improvement |
|---|--|---|-------------------------------------|-------------|
| Global Warming Potential (GWP)                | Total greenhouse gas emissions (CO <sub>2</sub> -eq) from energy use, sulfur combustion, etc.                        | High (due to fossil-based energy use)   | Medium (with energy recovery)       | 15–25%      |
| Acidification Potential                       | Emissions of SO <sub>2</sub> , NO <sub>x</sub> , HF affecting soil and water acidity                                 | High (SO <sub>2</sub> , HF release)   | Lower (HF capture, gas scrubbing)   | 40–60%      |
| Eutrophication Potential                      | Nutrient-rich wastewater discharge causing algal blooms  | Moderate (H <sub>3</sub> PO <sub>4</sub> , H <sub>2</sub> SO <sub>4</sub> traces in effluent) | Low (better wastewater control)     | 30–50%      |
| Photochemical Ozone Creation Potential (POCP) | VOCs, NO <sub>x</sub> , HF reacting with sunlight to create smog   | Low   | Very Low                            | 10–20%      |
| Human Toxicity Potential                      | Emissions of HF, H <sub>2</sub> SO <sub>4</sub> aerosols, and H <sub>2</sub> SiF <sub>6</sub> impacting human health | High (if gases not controlled well)   | Low (with absorber and scrubbing)   | 60–80%      |
| Water Consumption                             | Total freshwater used in process cooling, dilution, scrubbing  | High (especially cooling air water)   | Medium (recycling of water streams) | 30–40%      |

**Product Carbon Footprint (PCF) (Optimized Scenario)**

| Stage                    | Carbon Intensity | Optimizations & Impacts   |
|--------------------------|------------------|---|
| Phosphate Rock Mining    | Medium           | Same as baseline  |
| Sulfuric Acid Production | Medium           | Partial recycling of acid stream; lower virgin acid requirement             |
| Reaction & Filtration    | Medium           | No change in chemistry, but better temperature control reduces loss         |
| Gas Handling & Scrubbing | Low              | High-efficiency absorbers with >95% H <sub>2</sub> SiF <sub>6</sub> capture |
| Evaporation              | Medium           | Heat integration using reactor waste heat reduces steam consumption         |

|                             |               |   |
|-----------------------------|---------------|---|
| Waste Handling              | Low-to-Medium | Lower volume of waste, potential valorization of $\text{H}_2\text{SiF}_6$ as by-product |
| Electricity Use (Auxiliary) | Medium-Low    | Process integration reduces pumping and reprocessing loads                              |

### 6. Perform a Cost-Benefit Analysis:

| Component                                       | Baseline Scenario   | Optimized Scenario   | Cost (₹/year)        | Benefit (₹/year)                      | Remarks  |
|---|---|--|----------------------|---------------------------------------|--|
| 1. Absorber Gas Recovery                        | 70–75% $\text{H}_2\text{SiF}_6$ recovery<br>HF loss: ~480 kg/hr | >95% $\text{H}_2\text{SiF}_6$ recovery<br>HF loss: <50 kg/hr                         | ₹25–30 lakhs (CapEx) | ₹60–70 lakhs                          | $\text{H}_2\text{SiF}_6$ market value ₹30–40/kg    |
| 2. HF Emission Control                          | Wet scrubbing (partial capture)                                 | Advanced scrubbing (multi-stage)   | Included above       | ₹5–10 lakhs                           | Reduced environmental fines, safer work conditions |
| 3. Heat Recovery (Reactor Cooling)              | No recovery<br>Heat lost in air cooling                         | heat exchangers for feed preheating  | ₹20 lakhs (CapEx)    | ₹30–40 lakhs                          | Saves steam/fuel for preheating feed               |
| 4. $\text{H}_2\text{SO}_4$ Recovery from Filter | 1.5% acid loss (~247.5 kg/hr) with gypsum                       | Acid stream recovery (94% $\text{H}_2\text{SO}_4$ )                                  | ₹5 lakhs (O&M)       | ₹15–20 lakhs                          | Reduces fresh acid demand and disposal             |
| 5. Evaporator Optimization                      | Direct steam evaporation  | Heat-integrated evaporator system  | ₹15 lakhs (CapEx)    | ₹20–25 lakhs                          | Energy efficiency, lower evaporation cost          |
| 6. Gypsum Valorization                          | Land/sea disposal (₹500–₹1000/ton)                              | Potential use in cement/fertilizer industry  | ₹5 lakhs (logistics) | ₹10–15 lakhs                          | Gypsum ~110700 kg/hr = ~950 T/day                  |
| 7. Regulatory Compliance Benefit                | Moderate risk of fines & penalties                              | Enhanced control of HF, $\text{H}_2\text{SiF}_6$ , $\text{H}_2\text{SO}_4$ emissions | —                    | ₹5–10 lakhs (avoided cost)            | Non-monetary but important                         |
| 8. Carbon Savings                               | Higher emissions → higher PCF                                   | Lower PCF via optimization   | —                    | ₹5–10 lakhs (carbon credit potential) | 0.1–0.2 tCO <sub>2</sub> e per ton of acid saved   |
